

## The perfect fit! The New York window handle with adjustable solid spindle

### The problem

There are many different profile systems available for aluminium, wood and PVC windows, and this stems in no small part from energy saving requirements and safety concerns, as well as design considerations. What is more, these systems also require compatible spindle lengths. Window handles available in a range of spindle lengths are therefore preferred. This is an inconvenient factor and it results in considerable additional logistical and administrative costs.

### The product solution from HOPPE

A single window handle for a range of window profiles. With the patent-pending, adjustable solid spindle for window handles, the right spindle length for a variety of window profiles is already in stock.

This is because the length of the adjustable spindle in the window handle adapts to the depth of the individual window profile, which is enabled by means of a pressure spring fitted on the spindle in the inside of the window handle. Thanks to the spring mechanism, the spindle is pressed smoothly into the square recess of the gear follower, ensuring a perfect fit.

The window handle with adjustable spindle can be used with an installation depth range of up to 10 mm and has been tested to RAL. It can be installed with ease and flexibility on window profiles of various depths.

The integrated Secustik® technology hinders movement of the window fitting and turning of the spindle from outside.

Compared to the current window handles with fixed spindle lengths, the new window handle with adjustable spindle reduces the number of variants considerably. The associated cost saving potential from the reduction in complexity is clear to see.

The adjustable spindle is used for the first time with the new Secustik® window handle model New York. It is supplied in the 32–42 mm version (projecting spindle length), complete with 2 pairs of screws.
