

Adjustable spindle: More versions to choose from

Previously, it was only available with the HOPPE New York model: the adjustable spindle, which spans profile thicknesses of up to 10 mm, thus enabling flexible assembly. This patented technology is now available for another attractive model: the adjustable spindle can now also be obtained for window handles in the Toulon series, which give your windows a modern edge with their strikingly angular design. Other handle designs following the latest interior design trends will also be available soon.

Now also with keyed locking

Keyed-locking versions of the handles with adjustable spindles are also new to the range. They provide both safety for children and active protection against break-ins. Closed or tilted windows can be locked quickly and easily "at the touch of a button" on the lock. A large reversible lock makes them even easier to handle.

With HOPPE break-in protection technology Secustik® and Secu100® + Secustik®

HOPPE window handles with adjustable spindles impress not just with their attractive design and easy fitting but also with the protection they provide: because all versions with adjustable spindles have integrated Secustik® technology. This makes it more difficult for the spindle to be turned and thus for the window gearing to be moved from outside. The handles with keyed locking in the New York and Toulon series are also equipped with Secu100® + Secustik®; in other words, the handles can withstand an applied force of up to 100 Nm. This makes forced turning or pulling of a locked window handle so difficult that opening of a window by force becomes improbable.
